

CLINICAL RÖENTGENOLOGY OF THE CARDIOVASCULAR SYSTEM.

By HUGO ROESLER, M.D. pp. xvi + 343 with 199 figs. Baillière, Tindall & Cox. 1937. Price 34/-.

Clinical Röntgenology of the Cardiovascular System, by Hugo Roesler, M.D., is a book which appeals to the radiologists and clinicians specially interested in cardiology.

The author rightly takes up the position that the examination of the cardiovascular system by means of X-rays is but one of several methods of study and, necessarily, has very definite limitations. He lays great stress on the necessity of a sound knowledge of anatomy and physiology in addition to a knowledge of radiology. Mistakes and disappointments will occur when those who are not thoroughly trained undertake this work. There is a danger that over-specialization in a particular method of radiological investigation makes the worker tend to over-estimate its value. On the other hand, those who cannot use a particular method of investigation often neglect and under-estimate its value.

The opening chapter deals with technique, which is given in full detail. This is followed by a chapter in which the anatomical and X-ray findings are compared.

Further chapters are devoted to the normal cardiovascular system, to the various methods of measurement, and to the many pathological conditions.

At the end of each chapter is an extensive bibliography, which is one of the most useful features of a book that can be recommended as an authoritative work on this subject.

The illustrations are numerous and well chosen. The publishers are to be congratulated on a volume which will be a welcome addition to the library of all those interested in this subject.

THE CONTROL OF TUBERCULOSIS IN ENGLAND—PAST AND PRESENT.

By G. GREGORY KAYNE, M.D., M.R.C.P., D.P.H. Oxford University Press. London. 1937. Price 8/6.

This monograph by Dr. Kayne opens with an excellent survey of what has already been accomplished in the fight against tuberculosis and a critical analysis of the means employed. This is followed up by an account of the present state of matters and a discussion of the measures which, in the opinion of the author, must be adopted if further progress is to be made. Better co-ordination of all branches of the medical profession and a more complete supervision by the State is the only solution in Dr. Kayne's opinion, and we must admit that he makes out a very strong case for this view. The book is a most important contribution to the literature of the subject and will be welcomed by all interested in this field of medicine.

Forthcoming Medical Books.
