METAPHEN

(ABBOTT)

(Di-Acetoxymercuri-4-nitro-2-Cresol)

A POWERFUL MERCURIAL GERMICIDE
500 TIMES THE STRENGTH OF PHENOL

To establish the antiseptic or bacteriostatic value of METAPHEN several series of experiments have been carried out, in which the new mercurial was compared with phenol, mercuric chloride, mercurophen, mercurochrome and acriflavine. The bacteria employed were principally staphylococcus aureus, gonococcus and bacillus typhosus, and the work was carried out in two series: one in which the micro-organisms were exposed to the action of the chemical for one hour, and another in which the exposure lasted for four days, observation having been made every twenty-four hours. Metaphen was found to be 500 times more powerful than phenol.

In the second series, Metaphen was proved to be more than 20 times as effective against staphylococcus aureus as bichloride of mercury. In the same series the strikingly marked inhibitive power of METAPHEN against staphylococci was observed, when a solution of 1:20,400,000 proved to be efficient in the first 24 hours.

METAPHEN AND COLDS

In cases of acute coryza instil a 1 to 5,000 solution in the upper nasal passage, and repeat at intervals until the symptoms have subsided. The uses for METAPHEN as a powerful but non-irritating, non-staining germicide are manifold.

METAPHEN is packed in 4 oz. bottles of a 1:500 solution. Price 6/6. A solution of 1:5000 is the strength most commonly employed. Write for literature and clinical sample to
