

“It is concluded that maintenance treatment of ulcerative colitis with sulphasalazine (salazopyrin) should be continued indefinitely unless contraindicated by side effects”¹

The results of the above controlled trial carried out at the Nuffield Department of Clinical Medicine, Radcliffe Infirmary, Oxford, are all the more welcome as earlier trials of cortisone² and prednisone³ at standard dosages have shown them to be totally ineffective in reducing the number of recurrences of ulcerative colitis.

“Fortunately, Sulphasalazine tablets, 0.5 grams, 4 times a day will prevent relapses in the majority of patients with colitis, and only a few patients cannot tolerate this relatively small dose, which can be continued indefinitely, since we do not know when, if ever, it can be safely stopped”⁴.

“The patients who received dummy tablets had more than four times the relapse rate of those receiving sulphasalazine”¹ (Salazopyrin).

Salazopyrin (sulphasalazine) is available as the plain 0.5 g. tablet, 0.5 g. EN-tab and as an 0.5 g. suppository. Literature and detailed information on Salazopyrin are available on request.

Journal of Immunogenetics

Edited by K. Bauer *Heidelberg*

The purpose of this new journal is to provide a medium for the rapid publication of research papers and review articles of high quality in the field of immunogenetics. Its scope includes the immunogenetics of antigens, such as proteins, histocompatibility and blood group antigens; of antibodies as well as the ontogenetic development and the evolution of immunoglobulins, the immune response and the complement system. Other topics will include the genetics of tolerance-induction and of membrane antigens of the immunocyte.
