Book reviews

The Biochemistry and Pharmacology of Antibacterial Agents

By R. A. D. WILLIAMS and Z. L. KRUK. Pp. 89, illustrated. Croom Helm, London, 1981. £3.95.

This book is a small, short (89 pages) paperback which would be more correctly titled 'The modes of action of antibacterial agents (with notes on pharmacology)'. In the usual manner of books which detail the modes of action of antibiotics the chapters are devoted to particular general types of action, e.g. inhibition of cell wall synthesis, inhibition of nucleic acid synthesis, inhibition of protein synthesis, etc. rather than to particular classes of drugs. Short notes on the pharmacology of individual drugs appear at the end of the chapter in which the drugs were discussed in relation to their modes of action.

The book provides reasonably detailed accounts of the mode of action of antibacterials and would be useful for students requiring a quick and easily understood introduction to this subject. There are areas, however, where it could have been more in line with current thinking. For example, penicillin-binding proteins are not mentioned in relation to the mode of action of β -lactams. Each chapter has a section entitled 'Sensitive bacteria and resistance'. We would have liked to have seen this part of the book enlarged since mode of action and resistance go hand-in-hand and knowledge of mechanisms of resistance would seem just as important as knowledge of modes of action and just as interesting scientifically. There are some unfortunate omissions from the scanty information on mechanisms of resistance given. Nothing is said about resistance to trimethoprim, and the acetyl transferases which inactivate aminoglycosides are not mentioned, although in some parts of the world these are major causes of aminoglycoside resistance. In the context

of bacterial sensitivity and resistance an important error in the book is the incorrect definition of MIC (minimal inhibitory concentration) on p. 20.

The book is weak when pharmacology is being discussed mainly because the authors' knowledge of antibacterials seems to have stopped short at some ten years ago. No penicillin more recent than ampicillin nor cephalosporin than cephalixin is mentioned, although cephamycins and thienamycins are briefly described. Even then there are patent errors, such as omitting to mention that metabolism is an important mechanism of cephalothin excretion. Anyone reading page 55 might be encouraged to give cephalothin intramuscularly; it is in fact excruciatingly painful. If the pharmacology is weak, then the implied clinical comments are little short of historic. Phosphonomycin (sic) is not a new discovery, and has been in extensive clinical use in Mediterranean countries for at least two years. Trimethoprim is now available as monotherapy, a fact which would have been anticipated by anyone familiar with modern chemotherapy. There are other errors and omissions examples of which are the misspelling of gentamicin, and a failure clearly to indicate which toxic reactions of antibiotics are dose related.

In conclusion, the parts of this book dealing with the modes of action give an adequate although dated account suitable for student reading. Unfortunately, the remainder of this book could positively mislead by reason of its naivety and lack of modernity, and cannot therefore be recommended.
