

The Long-Term Complications of Therapy for Cancer in Childhood and Adolescence

by Daniel Green, Department of Paediatrics,
Roswell Park Memorial Institute, Buffalo, USA

Recent improvements in prognosis have produced an increasing population of long-term survivors of childhood cancer, whose problems have only recently received the attention of clinical investigators.

This book provides paediatric and medical oncologists, paediatricians and internists with a detailed description of the recognised long-term complications, a discussion of factors that are known or suspected to increase the risk or severity of a particular complication, and recommendations for monitoring patients at increased risk of a particular complication.

Contents Introduction / The Central and Peripheral Nervous Systems / Vision and Hearing / Teeth and Salivary Glands / The Cardiovascular and Pulmonary Systems / The Musculoskeletal System / The Thyroid Gland / Liver and Intestine / Kidney and Bladder / Gonadal Function and Reproduction / Second Malignant Tumours / Psychosocial Complications / Appendix / Index
