COVID-19 has been the single greatest public health emergency in the history. The global demand for vaccine vastly outstrip available supply during this scale-up period. There is therefore a need to train up more vaccinators to maximise vaccine uptake in short time period.

Like most other vaccines, the COVID-19 vaccine should be given intramuscularly. Muscles have good vascularity, and therefore allowing injected drug to reach systemic circulation quickly, bypassing the first-pass metabolism.¹ Intramuscular injection of the deltoid muscle should be given along a line drawn vertically downwards from the mid acromion.² The manufacturers advise that the vaccine should not be injected intravascularly, subcutaneously or intradermally.³ Injecting a vaccine into the layer of subcutaneous fat with poor vascularity

resulting in slow mobilisation and processing of antigen leading to vaccine failure.⁴ The antigen may take longer to reach the circulation after being deposited in fat, delaying presentation to T and B cells that are essential for immune response. In addition, there is a risk that the antigens may be denatured by enzymes if they remain subcutaneously for prolonged period. Subcutaneous injections can lead to localised cellulitis, granuloma formation and abscess.

The COVID-19 vaccine has shown to have high efficacy if given correctly intramuscularly. Subcutaneous injection can happen inadvertently ([figure 1](#)), affecting efficacy of vaccination and potentiate local adverse events. It is vital importance to reinforce intramuscular injection training with competency assessment at intervals in order to maximise efficacy and maintain public confidence.

Contributors JYN contributed in planning, conduct and writing up the work.

Funding The authors have not declared a specific grant for this research from any funding agency in the public, commercial or not-for-profit sectors.

Competing interests None declared.

Patient consent for publication Not required.

Provenance and peer review Not commissioned; internally peer reviewed.
