COVID-19 pandemic: perspectives on trainee well-being from UK doctors on the general medical rota

We thank Dr Launer for the article entitled: ‘Burnout in the age of COVID-19’,

that, and the themed issue of your esteemed journal were read with great interest. We write to share perspectives on well-being before and during the COVID-19 pandemic from UK trainees on the general medical rota.

An online survey was sent to trainees from foundation year (first year post-qualification) to senior specialist registrar grade on the general medical rota at a UK hospital (n=53), at two points in 2020: in January, prior to the ‘first wave’ of the pandemic, and June 2020, in the midst. In January trainees (n=33) reported: feeling unsupported, heavy workloads, and emotionally disengaging to get the job done. Most (73%, n=24) had never attended a ‘debrief’; and 97% (n=32) felt they would find it useful. By June (n=20), there was in addition: distress regarding personal protective equipment, ‘acting up’ and fatigue. This is a potent cocktail for burnout.

The COVID-19 pandemic has exacerbated the emotional toll on trainees. Hope is on the horizon with the start of the vaccine rollout, but a difficult and challenging period remains immediately ahead.

We cite a role that Balint groups in particular can play in the evolving COVID-19 pandemic and beyond, improving the care we take of: ourselves, our colleagues and ultimately our patients. There is a real opportunity to improve this aspect of the trainee experience. Embedding this positive change into the culture within medicine is one that stands to provide both current and generational benefits. Support here is an important and realistic goal, so we truly can ‘build back better’.
